

**(57) Abstract**

The invention relates to a method, hardware arrangement and a terminal by means of which a caller is informed of the ability of the receiving party to receive the information sent by the caller. This is accomplished by a method and an arrangement in which a user-specific activity log (12) is created so that data in the said log can be transmitted to the calling party before establishing the communications connection proper. The data may also be used as decision-making criteria when making a decision about whether or not to establish a connection with the receiving party.
